

POPULATION AND DEMOGRAPHIC TRENDS

CHAPTER 3

INTRODUCTION

Population and demographic trends are primary factors affecting the land use pattern of communities, counties, and regions. The number of people, their age, the living arrangements in which they place themselves, the types of dwellings they choose to live in, and the places available to find employment all play an important role in how much land is needed to accommodate their choices. This chapter reviews the trends in population growth and the projected population change that is expected to affect Troy and its use of land.

HISTORICAL POPULATION TRENDS

During the mid-1800's, the Miami-Erie Canal was the primary method of transportation for both passenger and commercial use. With the introduction of rail service in the 1850's, much of the transportation business was removed from the Canal. During these two time periods. development remained compact and dense within towns; thus population increases during these periods were limited primarily to urban areas such as Troy. As the automobile became a more widespread mode of transportation in the 20th century, highways were improved which allowed people to begin to move outward from the concentrated centers of communities. Since the 1950's, this outward trend has accelerated growth in communities similar to Troy that are located on the edge of large urban centers such as Dayton. The dispersion has also caused development to encroach into more accessible unincorporated areas, such as Concord Township, that were once used exclusively for farming. Troy is one of many communities in the region that was once distinctly separate, but is now one of many nodes within an increasingly larger urban/suburban area. There are many contributing factors to suburbanization or "sprawl", they include but are not limited to development based upon market forces and strong private property rights, improved roadway systems, dependence upon the automobile as the sole means of transportation, a rapid increase in the number of automobiles per family, and finally socialization which answers why society continues to follow these trends.

CITY-TOWNSHIP AND CITY-COUNTY POPULATION COMPARISONS

Table 3-1 illustrates the changes in population for the "Troy City" and the "Troy Area" between 1910 and 2000. The "Troy City" population is considered to be only those individuals who reside within the City of Troy corporation limits. The "Troy Area" population is referred to those individuals who live in the City of Troy, Concord Township and Staunton Township as a whole. Although there have been steady increases, the largest occurred between 1950 and 1970. These increases were affected in part by three major factors: the construction of Interstate Route 75 through Miami County, the population increase brought on by the baby boom, and the relocation of large segments of population from central cities to small towns and suburban areas

Between 1970 and 2000, population growth of the Miami Valley Region remained somewhat stagnant. However, the Troy Area was one area within the Miami Valley Region that experienced a significant gain in population during this period. In fact, an almost equal amount of population gain was experienced in the Townships as in the City. This similar increase in population was unusual because population growth in rural and suburban townships in the Region usually occurred at the expense of nearby cities, not the other way around.

	Tray City	Troy A/ea	Miami County	% of Troy Area	Troy Area % of Miami County
2000	21,999	29.327	98,868	75.0%	29.0%
1990	19,956	26,432	93,182	75.0%	28.0%
1980	19,086	25,446	90,381	75.0%	28.0%
1970	17,186	22,919	84,342	74.0%	27.0%
1960	13,685	19,205	72,901	71.0%	26.0%
1950	10,661	15,563	62,000	68.0%	25.0%
1940	9,697	12,485	52,632	77.0%	23.0%
1930	8,675	11,781	51,301	73.0%	22.0%
1920	7.260	9,745	48,428	74.5%	20.0%
1910	6,122	8,375	45,047	73.1%	18.0%

Table 3-1 Troy City, Troy Area, and Miami County Population Comparison

This 1970 to 2000 increase for the Troy Area can be attributed to its location on the outer fringe of the Miami Valley Region, a place where adequate land was available at relatively low cost for housing development and where transportation access was convenient. Overall, construction of an adequate volume of new residential housing was maintained in both the City and the Townships to compensate for the decline in the number of persons per household discussed in Chapter 4.

The City of Troy's percentage of the Troy Area population has increased over the past several decades, most notably between 1950 and 1970. The 6% population increase was due to the fact that this annexed area became the location of Troy's two largest area residential subdivisions (Westbrook, Sherwood and Stonyridge). Figure 8-1 depicts the boundaries of Staunton and Concord Township, while Figure 9-3 illustrates the ground area annexed to the City during the 1950's and 1960's.

Table 3-1 also illustrates the Troy Area's population as a portion of Miami County. The share has increased from 18% in 1910 to 29% in 2000. The majority of this change occurred from 1910 to 1950, when most cities throughout the United States saw an increase in population due to new employment opportunities in commerce, industry and the public sector. This increase in the urban population during this time usually came at the expense of rural areas, which lost much of its farming population.

POPULATION COUNTS AND PROJECTIONS 1950-2007

Table 3-2 shows the 1950 to 2000 Census populations and percent changes of population for Troy and surrounding areas. The chart also shows a 2002 population estimate and a 2007 projected population number for each area. Troy's population continues to steadily increase and is projected to continue this trend.

Most of Troy's population growth occurred between the years of 1950 and 1970, when population increased almost 79%. During that same time period, Troy had the highest growth percentage rate of all the areas included in this comparison. Tipp City had a high percentage with 69.7% while Piqua had a percentage of only 17.3%.

The Miami Valley Region as a whole has seen both a decrease and a slowdown in their population growth since the 1980 Census. This suggests that individuals within the region are starting to migrate in other regions. The only city in this group that has seen a decrease in population was Piqua. Between 1970 and 1980 Piqua suffered a 1.3% decrease. Since that time the city had only slight increases compared to the other areas, which continue to steadily increase.

Miami County saw population growth rates far exceeding the regional average for the 2000 Census.

	Troy	Miami Valley Region	Mami County	Piqua	Sidney	Tipp City
	Total	Total	Total	Total	Total	Total
Projected 2007	22,094 0.00%		100,817		NA	9,831
Estimated 2002		944,298 0.00%	99,343	20.725	NA	9,388
2000 Census		950,558		20,738 0,60%	20,211 8.00%	9,221 53.09
1990 Census	1,000,000	951,270 1.00%	93,162	20,612 0.60%	18,710 6,00%	6,657 7.709

Table 3-2: Population Counts and Projections 1950-2007

POPULATION DENSITY

Table 3-3 illustrates the 2000 Census population density of Troy as compared to other areas such as the Miami Valley Region, Miami County, Piqua, Sidney and Tipp City. Troy has the highest density of persons per acre when compared with the other cities listed. This is probably due to the fact that Troy had comparatively lower amounts of recently annexed undeveloped land prior to 2000; Troy tends to develop its land within a relatively short period of time after incorporation. Although it is the densest of these communities, ample undeveloped land exists contiguous to and in the vicinity of its borders.

	Acreage	Square Miles	Population	Persons Per Acre	Persons Per Square Mile	Acres Per Person
Mami Valley Region	821,760	1.284.00	950,558	1.15	740	0.9
Miami County	260.506	407.04	95,658	0.38	245	2.6
Pigua	6,842	10.69	20,738	3.03	1,903	0.3
Sidney	8,662	10.41	20,211	3.03	1,939	0.3
Top Oly	3,955	6.18	9.221	2.33	1,512	0.4
Troy	6.208	9.70	21,999	3.54	2.268	0.9

Table 3-3 Population Density

AGE DISTRIBUTION

The age profile of the population within a community influences the labor supply, the demand on education facilities, the need for various types of social services, and the need for different types of housing. Table 3-4 provides a look at the pattern of age distribution of the Troy population between 1960 and 2000. Two trends are evident - the appearance and aging of the babyboom population and the continued prominence of the 65+ age group. As life spans continue to increase and as the baby-boom generation ages, this bracket will continue to grow significantly. Social services and hous-

ing types to fit the needs of this segment of the population will be important development factors. In addition, many within the 5-14 age group will soon begin to enter the labor force.

	1960	1970	1980	1990	2000
	Total	Total	Total	Total	Total
Under 5	1,562	1.791 10.4%	1,595	1,547 7.8%	1,591
5-14	2,582	3,384	3.078	2,907	3,109
15-24		2,813			
25-34	1,826	2,399	3,341	3,354	3,458
35-44	1.917	1,930	2.028	2.884	3,347
45-54	1,592	1,896	1.817	1,936	2.937
55-64		1,442			
65 *		1.531	2.210		2,968

Table 3-4 Troy Age Population Distribution 1960-2000

	1960	1970	1980	1990	2000
Troy	30.7	27.3	29.8	33.2	35.2
Miami Valley Region	N/A	N/A	N/A	33.4	37.7
Miami County	29.3	28.0	N/A	34.2	36.6
Piqua	31.1	28.6	29.8	32.1	35.3
Sidney	28.5	26.8	28.3	31.4	33.9
Tipp City	N/A	28.4	31.6	33.9	35.7

As shown in Table 3-6, Troy's 2000 median age (35.2) was one of the lowest of the compared areas. Only Sidney (33.9) had a lower median age. The Miami Valley Region as a whole had the highest median age at 37.7. Other areas, Miami County (36.6), Piqua (35.3), and Tipp City (35.7) all have similar median ages.

Table 3-5 shows the percent of population in each age distribution group for Troy, the Miami Valley Region, Miami County, Piqua, Sidney and Tipp City. Like these areas, Troy's population was most concentrated in the 25-54 and 65+ age brackets. The 25-34 and 35-44 age groups represent the baby boomers, which suggests that Troy possesses housing, schools, and access to employment opportunities that have been able to attract this major market segment of the population. Troy has also been able to attract its share of the 65+ age bracket, having approximately the same percentages of its population within this group compared to the Miami Valley Region, Miami County, and Tipp City. Piqua has the highest percentage in the 65+ category. Troy and Piqua's high percentage in the 65+ age bracket may be due in part to better accessibility to hospitals and medical and social services in the central and northern parts of Miami County.

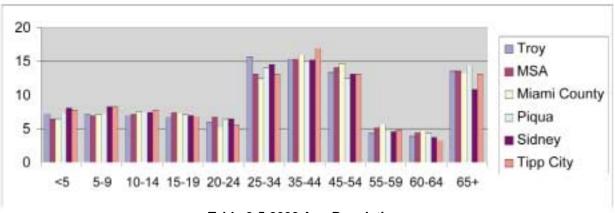

Table 3-5 2000 Age Population

GENDER DISTRIBUTION AND TRENDS

Table 3-7 shows the distribution by total number and percentages of the male and female population in 2000

for selected localities. Troy as compared to the other shown localities has relatively the same male and female population percentages. Miami County as a whole had the highest percentage of male population while Piqua had the highest percentage of female population.

Table 3-9 Combined Age and Gender Populations

RACE CHARACTERISTICS

Historically, Troy's population has been more racially diverse than some of the areas to which it was compared. In 1960, Troy had one of the highest non-white population percentages at 4.9%, and the same was true in 2000 when there was a nonwhite population of 8.5%. The only area that was compared that had a higher non-white population percentage was the Miami Valley Region as a whole. Tipp City was the least racially diverse from 1960-2000. In 1960 Tipp City had a

			1	,

Table 3-10 Non-White Populations 1960-2000

non-white population percentage of only 0.7%. This number only grew to 2.5% in 2000. Table 3-10 shows the non-white population percentages from 1960-2000 for all compared areas.

Table 3-11 shows population percentages by race for Troy and all compared areas. Troy had the highest "2 or more races" percentage in the Black and Asian populations, compared to other areas besides the Miami Valley Region. Tipp City once again had the lowest percentages in each of these categories.

2000 Population	One Race Only

Table 3-11 Population by Race

HOUSEHOLD CHARACTERISTICS

As shown in Table 3-12, all types of households within Troy increased in number between 1970 and 2000. The number of households increased approximately 27% between 1970 and 1980, almost 7% between 1980 and 1990, and approximately 17% between 1990 and 2000. Changes in lifestyle over the past 30 years have resulted in many changes to household patterns. Even though the number of family households has increased, their percentage of all households has been in decline. There has been a growth in both numbers and percentages of single parent families, as well as one-person and two-person non-family households. The number of all non-family households increased from 1,016 to 3,037 from 1970 to 2000. These trends have resulted in a significant drop in the average household size from 3.06 persons in 1970 to 2.40 persons in 2000.

The total number of children living in Troy decreased from 6,074 to 5,635 between 1970 and 2000. During the same period the proportion of children living in a family remained almost unchanged.

However, the number of children living with only one parent increased from 11.8% of the 1970 total to 28.1% of the 2000 total. In addition, the number of children not living

with any parent increased from 52 to 415 during the same period. In contrast, the number of persons 65 and older in Troy increased from 1,531 in 1970 to 2,968 in 2000. Of these individuals, the number living in a family decreased from 65.4% of the 1970 total to 57.5% of the 2000 total. Those seniors living in a non-family group environment, i.e. a nursing home, increased from 2.1% to 7.7% during the same period. These trends suggest the need for less new housing to accommodate families with children, i.e. single family detached homes, and a greater need for attached senior housing in the Troy community.

Table 3-13 illustrates the comparison between Troy's 2000 household profile and the profile for the Miami Valley Region, Miami County, Piqua, Sidney, and Tipp City. Troy has the lowest percentage of family households at 66.0% while Miami County had the highest percentage at 72.7%. Troy also had the highest percent (34.0%) of non-family households while Miami County had the lowest percentage (27.3%). This could explain why Troy has the lowest number of persons per household with only 2.40 individuals. Miami County had the highest number of persons per household with 2.54.
